

Journal club checklist:

- Intended use and benefit: what's the added benefit of using this model compared to standard clinical care?
- Data description: briefly describe how data is acquired (e.g., sample size, demographics, data source, data acquisition settings, data availability, ...)
- Task description: Which task are we considering? If this is a supervised approach, how was the ground truth defined?
- Data preparation: pre-processing, possibly augmentation, sampling, data splitting procedure ...
- High-level method description: what is the modeling framework? What's the proposed innovation / difference with the described state of the art?
- Feature extraction: is there any feature engineering / selection involved? If not, how is representation learning tackled?
- XAI: Is the method explainable? If so, to what extent?
- Bias/Fairness/Inclusion: Discuss whether the approach is accounting for diversity / focusing on a specific population.
- Generalizability: Is external validation considered? How well do you expect the method as it is to generalize? What could be done to improve?
- Performance evaluation: which performance metrics are considered? Why?
